

## On-line survey

# Are you sensitive to every day sounds?

People with decreased sound tolerance may experience tinnitus, hyperacusis, misophonia and phonophobia. Decreased sound tolerance is a challenging topic to study and a challenging symptom to treat.

It's a condition that is often misunderstood even though it affects millions of people worldwide and can have a devastating effect on both your personal and professional life.

While many people can tune out every day sounds of life most of the time, other people can have strong emotional, physical reactions to sounds

If you are sensitive to sounds, a research project from the University of Melbourne would like you to participate in their survey.

The aim of the project is learn more about sound sensitivity conditions and put this knowledge towards understanding and helping people who suffer from sensitivity to sounds.

The project is called "Do You Hear What I Hear?" and is led by PhD candidate Krysta Callander, Melbourne School of Psychological Sciences.

You can read more about the survey and participate here
